Instructions

1. **Open the main.ipynb file in Google Colab.**
2. **Run the git clone cell** to clone the repository.
3. **After cloning:**

Navigate to:

/content/PFLlibVSP/system/utils/data_utils.py

and **replace the data_utils.py file** with the one provided in the ZIP folder.

/content/PFLlibVSP/system/flcore/trainmodel/models.py

and **replace the models.py file** with the one provided in the ZIP folder.

4. **Run the rest of the Jupyter notebook.**
5. **(Optional)** If you need to change the model:
    - Go to **line 508** in the notebook.
    - **Replace sslstm with informer.**

```
                        help="The goal for this experiment")
    parser.add_argument('-dev', "--device", type=str, default="cuda",
                        choices=["cpu", "cuda"])
    parser.add_argument('-did', "--device_id", type=str, default="0")
    parser.add_argument('-data', "--dataset", type=str, default="driving10_fg34")
    parser.add_argument('-nb', "--num_classes", type=int, default=10)
    parser.add_argument('-m', "--model", type=str, default="sslstm")
    parser.add_argument('-lbs', "--batch_size", type=int, default=64)
    parser.add_argument('-lr', "--local_learning_rate", type=float, default=0.005,
                        help="Local learning rate")
```
